Get up close and investigate marine creatures, explore the marine environment, measure what's in the water, get your students involved and engaged by joining the UNH Marine Docent Floating Lab Program! It's a valuable teaching tool that students will remember for a lifetime.

These trips provide wonderful support for many of the science standards for middle and high school students. We refer to this program as a 'coat hanger experience,' as you can 'hang' or build multiple lessons on this one program.

Five boat stations include benthic communities, plankton, water characteristics, water column characteristics, coastal navigation and bottom trawl. Feel free to personalize your program by incorporating English, history or art as one of the boat stations as well.

If you're interested in bringing your students, please contact us. We have a great volunteer crew of UNH Marine Docents who have been trained extensively in all facets of marine life and ecosystems. They make learning fun and memorable!
